Package 'preparationCurator'

March 24, 2021

PreparationSPoTApi_add_preparations

Add new preparation object

Description

Add new preparation object

Usage

```
PreparationSPoTApi_add_preparations(source, ...)
```

Arguments

source

PreparationSPoTApi_delete_preparation

Delete a preparation object

Description

Delete a preparation object

Usage

```
PreparationSPoTApi_delete_preparation(id, ...)
```

Arguments

id

Unique identifier (accession) of the object.

 ${\tt PreparationSPoTApi_delete_preparation_group}$

Delete a preparation group with all related preparation objects

Description

Delete a preparation group with all related preparation objects

Usage

```
PreparationSPoTApi_delete_preparation_group(id, ...)
```

Arguments

id

Unique identifier (accession) of the object.

 ${\tt PreparationSPoTApi_get_preparation}$

Retrieve a single preparation object by ID (accession)

Description

Retrieve a single preparation object by ID (accession)

Usage

```
PreparationSPoTApi_get_preparation(id, returned_metadata_fields, ...)
```

Arguments

```
id Unique identifier (accession) of the object.
returned_metadata_fields
```

The parameter defines amount of metadata attributes to return: 1. template return metadata attributes according to applied template, if object doesn't have applied template default template will be used. This is the default for User endpoints. 2. all - return all metadata attributes with values and null attributes, if they are present in the applied template. This is the default for Curator endpoints.

```
PreparationSPoTApi_get_preparations_by_group

*Retrieve preparations related to the given group*
```

Description

Retrieve preparations related to the given group

Usage

```
PreparationSPoTApi_get_preparations_by_group(
   id,
   returned_metadata_fields,
   page_offset,
   page_limit,
   ...
)
```

Arguments

id Unique identifier (accession) of the object.

returned_metadata_fields

The parameter defines amount of metadata attributes to return: 1. template - return metadata attributes according to applied template, if object doesn't have applied template default template will be used. This is the default for User endpoints. 2. all - return all metadata attributes with values and null attributes, if they are present in the applied template. This is the default for Curator endpoints.

page_offset

Show the page pageOffset+1 results from the start of the results. E.g. 100 will show a page of results starting from the 101st result. The default value is 0.

page_limit

Maximum number of results to return per page (see Paging above). This value must be between 0 and 2000 (inclusive). The default is 2000.

PreparationSPoTApi_get_preparation_by_version

Retrieve a single preparation object by ID (accession)

Description

Retrieve a single preparation object by ID (accession)

Usage

```
PreparationSPoTApi_get_preparation_by_version(
   id,
   version,
   returned_metadata_fields,
   ...
)
```

Arguments

id Unique identifier (accession) of the object.

version Unique version of the object.

returned_metadata_fields

The parameter defines amount of metadata attributes to return: 1. template return metadata attributes according to applied template, if object doesn't have applied template default template will be used. This is the default for User endpoints. 2. all - return all metadata attributes with values and null attributes, if they are present in the applied template. This is the default for Curator endpoints.

PreparationSPoTApi_get_preparation_versions

Retrieve a list of object versions by ID

Description

Retrieve a list of object versions by ID

Usage

```
PreparationSPoTApi_get_preparation_versions(id, ...)
```

Arguments

id

Unique identifier (accession) of the object.

PreparationSPoTApi_search_preparations

List or search for preparation metadata objects

Description

List or search for preparation metadata objects

Usage

```
PreparationSPoTApi_search_preparations(
  filter,
  query,
  search_specific_terms,
  returned_metadata_fields,
  sort,
  page_limit,
  page_offset,
  ...
)
```

Arguments

filter Filter by preparation metadata (key-value metadata pair(s)). E.g. Digestion=Trypsin query Search for preparation objects via a full-text query over all preparation metadata

fields. E.g. "reversed-phase liquid chromatography"

search_specific_terms

If the full-text query term is present in an ODM dictionary, enabling this parameter will modify the query to include child terms of the full-text query. For example, the search query "Body fluid" can be expanded to include the term "Blood" (a child term of "Body fluid") so files containing either "Body fluid" or "Blood" in their metadata will be returned in the search results. The parent-child relationship is defined by the key "broaders" in the dictionary. If the full query term is not present in a dictionary then this parameter has no effect.

returned_metadata_fields

The parameter defines amount of metadata attributes to return: 1. template return metadata attributes according to applied template, if object doesn't have applied template default template will be used. This is the default for User endpoints. 2. all - return all metadata attributes with values and null attributes, if they are present in the applied template. This is the default for Curator endpoints.

sort Attribute to sort by, with optional ascending/descending marker, of the form

"[+|-]<key_name>". No marker or "+" indicates ascending sort, and "-" indi-

cates descending sort. *Default:* sort by ID in ascending order.

page_limit Maximum number of results to return per page (see Paging above). This value

must be between 0 and 2000 (inclusive). The default is 2000.

page_offset Show the page pageOffset+1 results from the start of the results. E.g. 100 will

show a page of results starting from the 101st result. The default value is 0.

PreparationSPoTApi_update_preparation

Update a preparation object

Description

Update a preparation object

Usage

```
PreparationSPoTApi_update_preparation(id, body, ...)
```

Arguments

id Unique identifier (accession) of the object.

body Metadata in the form of {key: value, key2: value2, ...}
